

said first end having a hook secured thereto, and  
said second end having means for securing said second end to a  
support,

said means for securing said second end to a support comprising a  
first jaw and a second jaw,

said first and second jaws being secured together by a pivot, and  
said first and second jaws being movable from a first position to a  
second position about said pivot, and

wherein when said first and second jaws are in said first position,  
they are closely adjacent one another, and

when said first and second jaws are in said second position, they are  
remote from one another, and

means for holding said first and second jaws in said first position,  
and

wherein said means for holding said first and second jaws in said  
first position is a spring, and

wherein said spring is wound around said pivot and has a pair of  
arms,

one of said pair of arms engaging an outside surface of said first  
jaw, and

another of said pair of arms engaging an outside surface of said
